

AFTER SALES // BE A STEP AHEAD

ARE YOUR SYSTEMS UP-TO-DATE - SECURING YOUR FUTURE PROFIT?

Equipment running at its best is the key to maintain yield improvements. Your software and hardware are an essential part of this process, and being up to date is more important than ever. Below you will find two upgrades which have great importance to secure your future profit.

Siemens SIMATIC S7-1500 migration

Upgrade from SIMATIC S7-300 (which will be phased out no later than 2023, www.siemens.com/s7-300) to S7-1500 TIA for improved performance, innovative real-time concepts, and a higher level of data security. As Siemens Solution Partner, we can perform a life check of your PLC hardware and present you with a full report, including recommendations, migration plan and budget.

From Profibus to Profinet

Upgrade your electrical panels and maintain maximum uptime thanks to a more stable connection and availability of spareparts. Going from Profibus to Profinet enables you to follow performance at a component level, such as monitoring the status of the inverters. Remote access and advanced analytics make troubleshooting and adjustments easier, securing a low mean time to repair and increased profit.

We are here for you

Whether the upgrade is on your Frontmatec or Nawi equipment, we are your trusted partner and provides you with the experts, skills and know-how to ensure your plant is a step ahead, thanks to maximized uptime and yield improvements.
